

AMBER ESOL · USER MANUAL

Amber Demo Call Run Sheet

A step-by-step guide with pictures from the real system. Written to be read by learners — simple words, short steps.

Generated 2026-09-26 · Amber Training Ltd

Amber ESOL Demo Call Run Sheet

Follow this top to bottom on the call. Every step tells you exactly where to click, what to type, and what to say. Total running time is about 40 minutes. Steps marked **SAY** are your talking points; steps marked **DO** are your clicks.

Before the call (15 minutes before, not during)

1. Start the backend: open a terminal in `amber-esol-backend` and run `npm run dev`. Wait for "connected" in the log.
2. Start the frontend: open a terminal in `amber-esol-mvp` and run `npm start`. Wait for `localhost:3000` to open.
3. Restore the demo state (this re creates Lara's unread teacher message and the pending Stage 5 review if a previous demo consumed them). In `amber-esol-backend` run:

```
npx ts-node --transpile-only src/scripts/prepManualDemoData.ts
```

4. Open **two browser windows** side by side:
 - Window A (normal): your main window for admin, teacher, and org admin logins.
 - Window B (incognito/private): reserved for the learner joining flow, so two accounts can be signed in at once.
5. Test one login (any account from the table below) and log out again.
6. Check your internet. The AI tutor replies, placement scoring, and the cohort summary all use live Gemini calls.
7. Have this script open on a second screen or printed.

Voice: text to speech and the microphone (optional, do this the day before)

The AI tutor can read its lines aloud (a **Listen** button on every Amber message) and the learner can speak an answer instead of typing it (a **Record your answer** microphone next to the input). Both are built and tested, but they are switched off until two things happen. Right now they are off, so if you skip this section the session simply runs text only and nothing looks broken.

1. Enable two Google APIs on the same Google Cloud project that already powers Gemini (project `trim-epigram-496314-m4`). Open each link, make sure that project is selected at the top, press **Enable**:
 - Cloud Text to Speech:
<https://console.developers.google.com/apis/api/texttospeech.googleapis.com/overview?project=trim-epigram-496314-m4>
 - Cloud Speech to Text:
<https://console.developers.google.com/apis/api/speech.googleapis.com/overview?project=trim-epigram-496314-m4> Wait two or three minutes after enabling.
2. In `amber-esol-backend/.env` change the two lines at the bottom from `false` to `true`:

```
VOICE_TTS_ENABLED=true
```

```
VOICE_STT_ENABLED=true
```

3. Restart the backend (`Ctrl+C` in its terminal, then `npm run dev` again).
4. Rehearse once: sign in as Lara, start a session, and check that a small speaker **Listen** button now shows under Amber's first message and a microphone button sits beside the text box. Press the microphone once in rehearsal so Chrome asks for microphone permission and you can press **Allow** before the call, not during it.

The voices are Google's EU hosted voices (London region), matched to the learner's language. If the buttons do not appear after step 3, the API enable has not propagated yet; wait a few minutes and restart the backend again.

Important warning: do NOT type anything about being unsafe, hurt, or frightened into the AI tutor during the demo. The safeguarding detector is real: it will raise a live alert and email the safeguarding inbox. You will show safeguarding from the admin side instead (Act 8), where a real open alert and a resolved one already exist.

The cast (all passwords are `TestPass1!` unless stated)

Role	Email	Use for
Amber admin	<code>seed-qa-admin@example.com</code>	Acts 2 and 8
Org admin (Seed QA Organisation)	<code>seed-qa-orgadmin@example.com</code>	Acts 3 and 7
Teacher (Theo)	<code>seed-qa-teacher@example.com</code>	Act 6
Learner (Lara, E3, two months of history)	<code>seed-qa-learner@example.com</code>	Act 5
Hillview org admin (Hana)	<code>hillview-admin@example.org</code>	backup org
Hillview teacher (Priya)	<code>hillview-teacher@example.org</code>	backup teacher

The learner you create live in Act 4 needs no email or password at all, which is itself a selling point.

Act 1: The story in one minute (no screen yet)

SAY: "Amber is an AI supported English learning platform for funded adult ESOL. Learners practise real UK life scenarios with an AI tutor that supports them in their own language. While they practise, the platform writes the compliance record automatically: guided learning hours, RARPA evidence, the ILR return. And every judgement that matters, a level achieved, a safeguarding concern, is confirmed by a person, never by the AI alone. I'll show you the whole journey: we'll create an organisation, invite a learner, watch them join and get placed, practise with the AI tutor, and then see what the teacher, the provider, and Amber each see."

Act 2: Amber admin provisions an organisation (4 min)

DO, in Window A:

1. Go to `localhost:3000/login` .
2. Email: `seed-qa-admin@example.com` · Password: `TestPass1!` · press **Sign in**.
3. You land on **Overview**. Pause here.

SAY: "This is Amber's own view: every client organisation, learners, hours this month, revenue, and billing state at a glance. You can see one client with a lapsed contract flagged in red."

4. In the sidebar press **Organisations**, then the orange **Provision organisation** button (top right).
5. Fill the form (say the values out loud as you type):
 - Organisation name: `Riverside Community College`
 - Contact name: `Dana Ellis`
 - Contact email: `dana@riverside-demo.org`
 - Phone: `07700900123`
 - Payment model: **Invoiced** · Invoice cycle: monthly
 - Admin first name `Dana` , last name `Ellis` , admin email `dana@riverside-demo.org` , admin phone `07700900123`
6. Press the create button and point at the new row in the list.

SAY: "One form creates the organisation and its first admin account together. The admin gets a welcome email and from that moment Riverside runs itself: Amber does not create learners for them. That is deliberate: providers own their learners, Amber owns the platform. For the rest of the demo I'll use Seed QA Organisation, which has two months of live history in it."

7. Top right, press your avatar, then **Sign out**.
-

Act 3: Org admin invites a learner (3 min)

DO, in Window A:

1. Sign in as `seed-qa-orgadmin@example.com` / `TestPass1!` .
2. You land on the **Cohort dashboard**. Do not explain it yet, that is Act 7. Just say: "This is the provider's home; we'll come back to it once our learner has some data."
3. Sidebar: press **Invitations**, then **New invitation**.
4. In the modal:
 - Learner email: leave **empty** (say: "with an email the invite is sent automatically; I'll use a link so you can watch the learner side live").
 - Assigned ESOL level: leave as **Set later** (the placement will decide).
 - Expires in: leave the default 30 days.
5. Press create, then press **Copy link** on the new invitation row.

SAY: "That link is the entire enrolment infrastructure. No account creation, no passwords to manage, no IT ticket. The provider sends this to a learner by text, email, or on paper as a QR code."

Act 4: The learner joins and gets placed at E3 (7 min)

DO, in Window B (incognito):

1. Paste the copied invite link and open it.
2. The welcome screen appears, branded for the organisation. Point at the **language picker, top right**. Click it and switch to العربية (**Arabic**).

SAY: "First decision the learner ever makes: their language. And watch the whole layout flip right to left for Arabic. Amber never assumes English."

3. Switch back to **English**. Press **Start**.
4. Walk the wizard steps, filling minimal details:
 - Details: first name **Amal** , last name **Hassan** , and whatever else the step requires.
 - Eligibility: answer the declarations honestly ("this is the ESFA eligibility evidence being captured at source").
 - ULN: **skip** (say: "the provider can record it later; the compliance dashboard flags it as missing until then").
 - Done: press through to the placement assessment.

SAY: "No email, no password. The learner is enrolled and goes straight to placement: twenty questions, adapting to their answers, scored by AI, and, important, reviewed by a teacher afterwards."

5. **The placement.** Twenty multiple choice questions. To land Amal at Entry 3, answer with this cheat sheet: get every E1, E2, and E3 question RIGHT and every L1 and L2 question WRONG. The level tag is not shown on screen, so recognise the question and use this table:

Answer these correctly:

When you see	Click
'NO ENTRY' sign meaning	You cannot go in
Shop 'OPEN 9am 5pm Mon to Fri', open Sunday?	No
Correctly written sentence (London)	I am from London.
How old is Sara?	25
Train to Manchester leaves at	3:30
How much was the milk?	£1.50
'I will meet you ____ the bus stop.'	at
Polite reply to 'How are you?'	I'm fine, thank you. And you?
Correct sentence (shops yesterday)	She went to the shops yesterday.
What do doctors recommend?	Walking for half an hour daily
Library closes at the weekend at	5pm
Politely ask to leave work early	Could I leave a bit early today, please?

Answer these wrongly (click the option shown):

When you see	Deliberately click
Tenancy agreement, one month's notice	Tell the landlord by phone on the day of leaving
Conditional sentence (rain)	If it will rain, I will stay home.
Meeting postponed because	Someone was late
Disagree with a colleague professionally	That is wrong.
Manager asks why you missed a deadline	I forgot about it.
Retail footfall article means	Online prices rose by 18%
Past perfect sentence	By the time we arrived, the meeting has already finished.
'Had we anticipated...' the speaker is	Making a prediction about the future

The first five questions are one from each level in rising order (E1, E2, E3, L1, L2), so early on expect: sign, train time, shops yesterday, tenancy, missed deadline.

6. Submit and wait a few seconds while it scores.

SAY (while it scores): "Gemini is scoring the attempt now: level, confidence score, and skill weaknesses. The result seeds everything downstream: the learner's scenario difficulty, their goals, and the funding paperwork."

7. The result lands at **Entry 3**. Show the learner's goals screen if offered (objectives written in plain language, agreed by the learner). Then leave Window B; Amal's part is done.

If the placement misbehaves live (network hiccup): close Window B and say "rather than fight the wifi, let me show you a learner who has been using Amber for two months", and go straight to Act 5.

Act 5: Living with Amber as a learner (8 min)

DO, in Window A (sign out of the org admin first):

1. Sign in as `seed-qa-learner@example.com` / `TestPass1!` .
2. A full screen note appears: **a message from her teacher**. Read it out loud.

SAY: "Teacher messages physically cannot be missed. They appear before anything else, translated into the learner's language when needed."

3. Press **Got it**. If a welcome panel appears next, close it too.
4. You are on Lara's dashboard. Point at, in order: her level badge (E3), the scenario picker, and the stats below.
5. Sidebar: **My Goals**. Show her objectives and the agreement note.

SAY: "These are her RARPA Stage 3 objectives, agreed by her, in her own words and language. Every practice session collects evidence against them automatically."

6. Sidebar: **Vocabulary**. Show retained versus in progress words.

SAY: "Every word she meets is tracked. A word only counts as retained after she has met it five times and used it correctly herself. This is the vocabulary evidence for her file."

7. Now the main event. Go back to the dashboard and press **Booking a GP appointment** in the scenario picker.
8. The PREPARE screen shows what she will practise and the key phrases. Press **Begin roleplay**.
9. Amber opens the conversation. Wait for its first message, then type exactly this and press Enter:

Hello, I would like to book an appointment with the doctor please.

10. Wait for Amber's reply (a few seconds; the typing indicator shows it thinking). Then type:

I have pain in my back for three days. It hurts when I sit for a long time.

11. **Voice moment (only if you enabled voice before the call)**. When Amber's second reply arrives, press the small speaker **Listen** button under it and let it play out loud.

SAY: "Every line the tutor says can be heard as well as read, in a natural voice matched to the learner's language. For a learner with low literacy in English, or in their own script, this is the difference between using the platform and not."

Then, instead of typing the third message, press the microphone button (**Record your answer**) next to the text box. The text box turns into a recording bar, like a voice note on a phone: a red dot and a running clock on the left, a live sound meter that moves as you speak, a red **pause** circle, a **bin** to throw the recording away, and a dark **send** arrow. Say clearly:

Thursday morning is good for me. What do I need to bring?

Point at the meter moving while you talk, then press the **send** arrow. (If you fluff a line, press the bin and start again; if you need a breath, press pause, the clock stops, then press it again to carry on.) A moment later her sentence appears in the conversation as a spoken answer, with a small microphone mark and a clarity chip under it (Clear, Nearly there, or Let's try that again) plus a one line pronunciation tip. Amber's reply will comment on how it sounded before carrying on.

SAY: "This is the part typing can never do. She spoke, the platform listened, and the tutor now knows how she pronounced it, not just what she meant. The clarity is scored, credited as speaking evidence, and flagged for the teacher to confirm. The audio itself is assessed in Google's EU region and never stored; Amber keeps only the words and the assessment."

If you did NOT enable voice, simply type the third message instead:

Thursday morning is good for me. What do I need to bring?

12. While replies come in, point at the screen furniture: the mode chip (BRIDGE means first language support is available, ANCHOR means maximum support, IMMERSION means mostly English), the text size button, and the four stage progress dots.

SAY: "Notice the tutor never just says 'correct'. It recasts her mistakes naturally, the way a good teacher does, and every turn is scored quietly in the background. Nothing she does here is wasted: it is all becoming evidence."

13. **Ending the session:** after Amber's third reply, press **End & review** (top of the chat). A completion panel appears with her score, the words she used, and the tutor's note.

SAY: "Ten minutes of practice, and the by product is a scored, transcribed, evidenced learning session. She just presses one button and she is done. Now let me show you what her teacher sees."

14. Sign out.
-

Act 6: The teacher's morning (6 min)

DO, in Window A:

1. Sign in as `seed-qa-teacher@example.com` / `TestPass1!` .
2. You land on the **Teacher Dashboard**. Give it a second to load, then walk the priority queue top to bottom.

SAY: "This is the whole product for teachers: who needs me, and why. P1 at the top: Stephen has an open safeguarding alert, act today. P2: Collins has gone quiet for a week, send encouragement. And the learners who are fine are parked in P4, on track, explicitly labelled no action needed. The teacher never hunts for work. Note the queue was built by the platform overnight, with the reason attached to every name."

3. Point at the **auto send toggle** above the queue: "if a learner goes quiet for two weeks, the platform checks in on the teacher's behalf, at most once a fortnight, and the teacher can turn it off."
4. In the cohort table press **Lara Learner** to open her record.
5. Walk the tabs quickly:
 - **Recent sessions:** open the top card, show the transcript of the session you just did in Act 5.
 - **Vocab and objectives:** her ledger and Stage 3 goals with progress.
 - **Your reviews:** the review history (append only, cannot be edited later).
 - **Activity:** the compliance trail.

6. Press **Log review** (right side). Pick **Async review**, set 15 minutes, and type notes:

Reviewed today's GP booking session. Clear progress on polite requests. Ready for the housing scenario next.

Tick "acted on the AI recommendation" and press **Save review**.

SAY: "That 15 minutes just became part of the organisation's claimable teaching hours, stamped with my name in the audit trail. Reviews cannot be edited after saving; the record stands as written."

7. Press **Send message**, type:

Great session today, Lara. Next time we will try talking to your landlord about repairs.

Point at the translation preview if her language is set, then **Send**.

8. Sign out.
-

Act 7: The provider's compliance view (6 min)

DO, in Window A:

1. Sign in as `seed-qa-orgadmin@example.com` / `TestPass1!`.
2. The **Cohort dashboard** loads (the table takes a few seconds; it is aggregating every session and evidence row live; fill the gap by reading the AI cohort summary at the top out loud).

SAY: "A plain English summary of the month, written by the platform from the real data, and under it the cohort: hours, teacher hours, scenarios passed, last activity, status, and whether we hold a ULN for each learner. This table IS the funding record."

3. Press **Lara Learner** (or go via **Learners**) to open her detail. On the overview point at the four hour cards.

SAY: "The most important distinction in the product: Total hours include AI practice. Claimable hours exclude it, only teacher contact and imported classroom hours count toward a funding claim. Both are shown side by side precisely so nobody ever claims the wrong number."

4. Press the **Evidence Chain** tab.

SAY: "Every claim traces back to the moment it was captured: which session, which turn, which ILR fields it feeds, which RARPA stage it satisfies, and whether a human has confirmed it. The AI's scores stay marked 'needs sign off' until a person confirms. This is what an auditor sees."

5. Go back to the Cohort dashboard and press the **Stage 5 Pending** tab. Open Lara's pending review.

SAY: "Lara completed Entry 3. Here is her own self assessment, the AI's summary of her evidence, and her teacher's sign off, already done. The final step is mine: the organisation confirms. Two different humans, in order, before anything becomes an achievement. Nothing the AI scores can be exported on its own."

6. **Optional live moment:** type into the required next steps box:

Progress to Level 1 pathway with an employability focus. Review at October half term.

and press **Confirm and lock**. (This consumes the pending review; the reset command in the last section restores it for the next demo.)

7. Quickly show **Export ILR** on the cohort dashboard: pick the organisation and dates, download the CSV, and open it for two seconds: "this is the file that goes to the funding body."
8. Sidebar **Invoices**: show the paid invoices. Sign out.

Act 8: Amber oversight: safeguarding, hours, audit (5 min)

DO, in Window A:

1. Sign in as `seed-qa-admin@example.com` / `TestPass1!` .

2. Sidebar: **Safeguarding**.

SAY: "The most important queue in the platform. During any AI session, if a learner discloses something worrying, the learner instantly sees a supportive message with real helplines, written by humans in advance, and an alert lands here with the safeguarding lead emailed within seconds. Here is a live one: high level, domestic abuse trigger, still open, and the SLA clock is running. And below it, July's alert: reviewed, escalated to the organisation, resolved the same day, with the notes preserved. The AI never handles the concern in the lesson. A person always does."

3. Press the open alert to show the review panel and its four outcomes. Press **Cancel** (do not resolve it; it is the standing demo of the duty).

4. Sidebar: **Response texts**: "the exact crisis messages learners see, per language, editable by us, never generated live."

5. Sidebar: **GLH analytics**. Point at Total versus Claimable cards, the teacher contact percentage with its ABOVE TARGET badge, and the weekly trend.

SAY: "Platform wide hours by source. The funding model targets teacher contact at ten to twenty percent of total hours: enough human oversight to satisfy the funder, little enough that the AI is doing the heavy lifting. We track that ratio continuously."

6. Sidebar: **Teacher utilisation**: two teachers, load, capacity, reviews and hours this month.

7. Sidebar: **Audit search**. Scroll slowly.

SAY: "And finally, the memory. Every compliance event across every organisation: sessions, placements, goals agreed, reviews, messages, nudges, level changes, safeguarding. Append only, nothing can be edited or deleted, by anyone. When an auditor asks what happened, this is the answer."

Wrap (1 min)

SAY: "So that is the full loop: the provider invites, the learner joins in their own language with no password, the AI tutors and quietly writes the evidence, the teacher spends their time only where a human is needed, the provider signs off achievements and exports the funding file, and Amber holds the safeguarding duty and the audit trail. Questions?"

If something goes wrong live

Symptom	What to do and say
Cohort table sits on a spinner	It aggregates live evidence; say so and give it ten seconds.
AI tutor reply is slow	"It is generating a level matched reply live." It arrives; do not resend.
Placement scoring fails	Close the incognito window; continue with Lara (Act 5). All later acts work without Act 4.
Teacher message modal reappears on learner login	That is the unread message from Act 6. Read it out: it proves the loop. Press Got it.
No Listen or microphone buttons in the session	Voice is off (flags false, or the Google APIs not yet enabled). Skip the voice moment; type the line instead. Nothing else is affected.
Listen button shows but nothing plays	The Google API enable has not propagated, or the tab is muted. Say "voice is optional" and move on; check after the call.
Microphone does nothing	Chrome blocked the mic. Click the camera/mic icon in the address bar, Allow, and retry once. Otherwise type the line.
Wrong dashboard after login	You are signed into another role in this window. Sign out via the top right avatar.
A page looks empty	Check you are signed in as the role that act names. Seed QA Organisation is where all the history lives.

Reset between demos

Run in `amber-esol-backend` (restores Lara's unread message, the pending Stage 5 review, and the open safeguarding alert if any demo consumed them):

```
npx ts-node --transpile-only src/scripts/prepareManualDemoData.ts
```

The organisation you provisioned in Act 2 can be deactivated from Organisations after the call, and each demo run should invent a new learner name in Act 4 (each invite link is fresh anyway).
